

You're not suffering alone!

Hemorrhoids are common in both men and women. According to the National Institute of Health, half of all adults between 50 and 70 suffer from hemorrhoids.

What causes hemorrhoids?

- Pregnancy
- Heavy lifting
- Obesity
- Poor diet
- Straining evacuating stool
- Childbirth
- Prolonged sitting
- Heredity
- Constipation

How does the HemWell procedure actually work?

While you are under sedation the physician determines the number, severity and treatment plan for the hemorrhoids. Without tissue penetration, a probe delivers low level direct current to the base of the hemorrhoid. This causes a chemical reaction in the hemorrhoid, triggering ligation within the vascular feeding vessels. The HemWell process essentially allows the body to heal itself. The hemorrhoid begins to shrink immediately and most patients feel no pain and are able to resume normal activity after the procedure.

What's at stake if not treated?

Left untreated the damaged blood vessels of the hemorrhoid will only get worse. This can lead to further pain, painful swelling, itching, bleeding, burning, protrusion and skin irritation.
